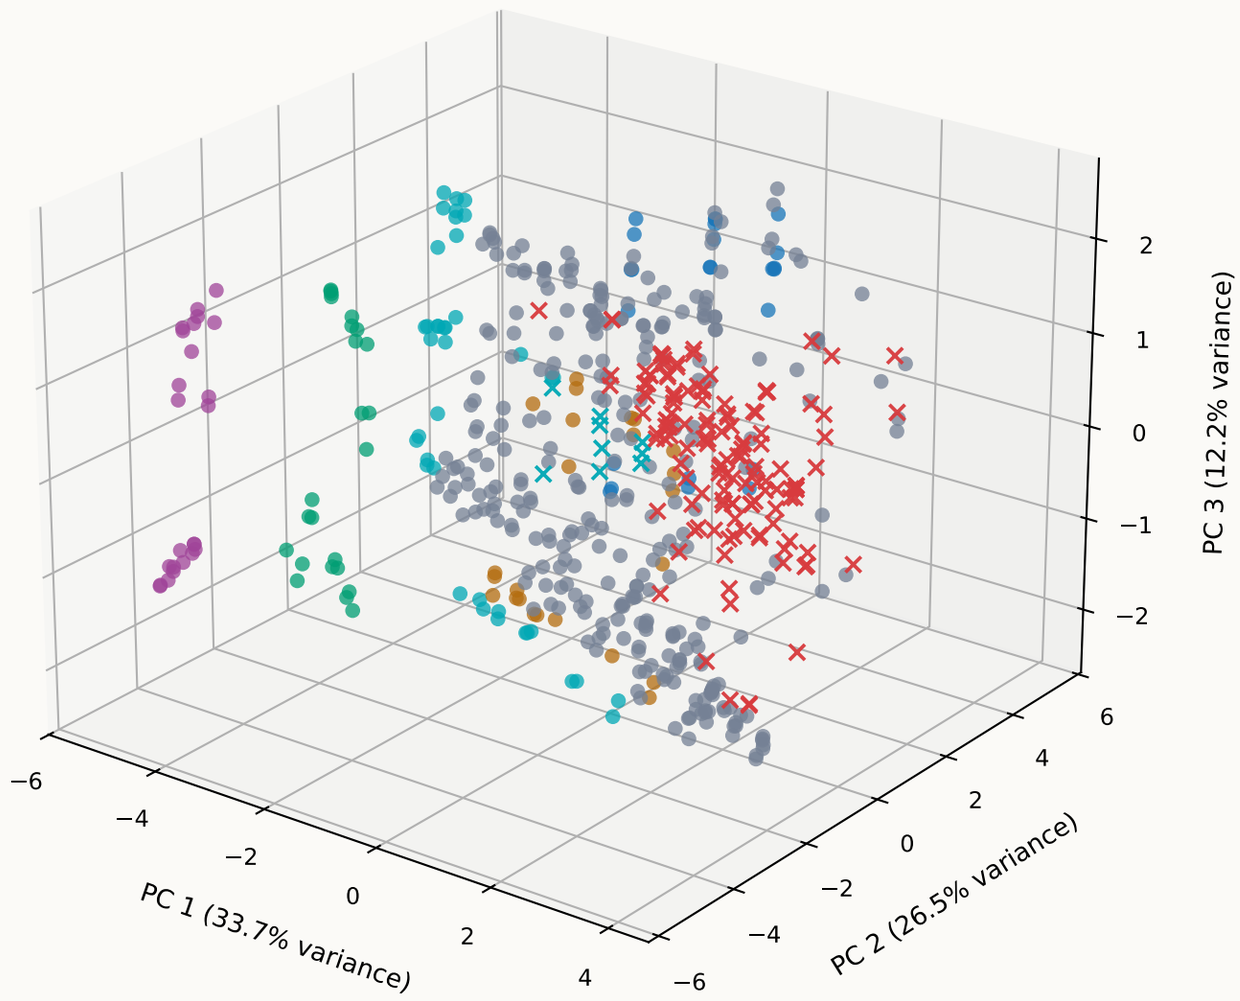
Paper VI | Easy and hard inputs in a representative 3D space

All 15 model features: 3D PCA (72.4% variance retained) | 576 unscaled cases, 144 weight lists



Color = structural type

- Superincreasing
- Complete coverage
- Few distinct values
- Small reachable support
- Interval / arithmetic progression
- Other solved input
- Hard: no certified full type

Shape = measured solver outcome

- Easy: finished within 8L
- Hard: unresolved within 8L

430 easy / 146 unresolved

9 known-type inputs are crosses: the original solver missed a known easy structure within its budget.

Classes can overlap; hover in the interactive view to see every match.

PCA uses features only; labels do not determine point positions. Projection can hide differences or overlap inputs.

'Hard' means this solver exceeded its budget. 'Other solved' does not establish a new polynomial-time class.
